To whom it may concern:

Marshfield, VT Village Water System, which I have operated the past 25 years, drilled a well in 2000 that tested almost .80 mg/L uranium. The MCL was .20. We provided bottled water several years, before the State approved a pilot project designed by Adedge Technologies. It was successful, so Adedge designed a unit based on the pilot. It is an ion exchange system which has consistently removed almost all the uranium. Tests have been down every quarter to almost zero. We have not had to perform any service work on the unit.

I have been more than pleased with the system and results. Feel free to contact me with any questions.

Rich Gouge, operator

Subject: Eco-Niobium - confirmation letter

Good morning Josh,

My associate Michel Gaucher has been in communication with Richard Gouge in connection with a confirmation letter stating your satisfaction with the use of AdEdge ion exchange technology for the treatment of uranium-bearing water for the municipality of Marshfield.

We have not received the letter and we very much appreciate receiving such letter for a meeting taking place on Thursday.

Please kindly email the letter to our attention.

Best regards,

Normand Champigny
